(54) Display system for projecting information to a driver of a car

(57) A head-up display system of an automotive vehicle, comprising outboard-side and inboard-side glass plates constituting a front windshield glass. The inboard-side glass defines therein a passenger compartment in which a driver resides. An intermediate film is disposed between the outboard-side and inboard-side glass plates to bond the glass plates. An optically functioning film arrangement is disposed between the outboard-side and inboard-side glass plates. The optically functioning film arrangement includes first and second polarization-direction changing layers, and a light-transmittable reflection layer disposed between the first and second polarization-direction changing layers. The three layers are laminated to form a single body of the optically functioning film arrangement which is bonded to the outboard-side glass plate and separate from the inboard-side glass plate so that a layer of the intermediate film lies between the optically functioning film arrangement and the inboard-side glass plate. A displaying device is provided to generate a display light of driving information. A light-polarizing device is provided to polarize the display light into P-wave. The display light having the P-wave is to be incident around Brewster's angle on the inboard-side glass plate and reaches the light-transmittable reflection layer to be reflected toward the driver so as to form a display of the driving information.

**ANNEX TO THE EUROPEAN SEARCH REPORT  
ON EUROPEAN PATENT APPLICATION NO.**

EP 97 11 7493

This annex lists the patent family members relating to the patent documents cited in the above-mentioned European search report. The members are as contained in the European Patent Office EDP file on  
The European Patent Office is in no way liable for these particulars which are merely given for the purpose of information.
